*An incredibly great book with perfect and lucid answers. Better then never, though i am quite late in start reading this one. You will not sense monotony at whenever you want of the time (that's what catalogues are for relating to if you question me).*

Excerpt: . . . DESCRIPTION OF SPECIES. ANNELIDA CONTLARIIDE. CONTLARIA Miller. CONULARIA sp. Plate VI, figure 8. Only two species of Conularia have been described from our upper Carboniferous rocks, *C. roeperi* and *C. crustula*, and the present form is much more similar to the latter than to the former species. It is represented in our collections by but a single specimen, which, when complete, may have had a length of about 25 mm. The cross section is square and the diameter at the larger end about 9 mm. The costae occur 11 in 5 mm. This species differs from *C. crustula* in being more gradually expanding and in having somewhat more closely arranged costae. It is therefore probably new, but the introduction of a new name seems hardly justified at present, because some important characters, such as the sculpture or crenulations on the costae are unknown, not being shown in our specimen.
